Theory and Practice of Logic Programming emphasises both the theory and practice of logic programming. Logic programming applies to all areas of artificial intelligence and computer science and is fundamental to them. Among the topics covered are AI applications that use logic programming, logic programming methodologies, specification, analysis and verification of systems, inductive logic programming, multi-relational data mining, natural language processing, knowledge representation,

Higher-order functions, as program-processing programs are called in functional programming, and meta-programs, as they are called in logic programming, are widespread declarative programming techniques. In logic programming, there is a gap between the meta-programming practice and its theory: The formalizations of meta-programming do not explicitly address its impredicativity and are not fully adequate.

In this model-theoretic semantics, reactive rules are the driving force, and logic programs play only a supporting role. In the canonical model, states, actions, and other events are represented with timestamps. But in the operational semantics (OS), for the sake of efficiency, timestamps are omitted and only the current state is maintained.

The Association for Logic Programming (ALP) was founded in 1986. Its mission is "to contribute to the development of Logic Programming, relate it to other formal and also to humanistic sciences, and to promote its uses in academia and industry all over the world". It manages the International Conference on Logic Programming, oversees the Theory and Practice of Logic Programming (TPLP) journal ...

A program logic model sets out the resources and activities that comprise the program, and the changes that are expected to result from them. It visually represents the relationships between the program inputs, goals and activities, its operational and organisational resources, the techniques and practices, and the expected outputs and effects.

How to develop a program logic for planning and evaluation ...

Logic programming is a programming paradigm which is largely based on formal logic. Any program written in a logic programming language is a set of sentences in logical form, expressing facts and rules about some problem domain. Major logic programming language families include Prolog, answer set programming (ASP) and Datalog.

A logic model connects activities of a program with the expected outcomes of a program in a clear, logical fashion. Logic models can be very useful in describing a program to potential participants and funders, and can be helpful in identifying key concepts for program evaluation. For more information.

Answer set programming (ASP) is a method for solving hard problems using computational logic. We describe a problem as a set of formulas of a declarative logical language in such way that the solutions correspond to the models (answer sets) of the set and then use a general-purpose inference engine to find the

From a functional programming point of view, logic programming aspects can be integrated into functional languages by permitting logical variables in expressions and replacing the matching operation in a reduction step by unification. From a logic programming point of view, functions can be integrated into logic languages by combining the resolution principle with some kind of functional evaluation.
